1. Overview

BlueFairy FarmBooks is a self-hosted WordPress accounting plugin built specifically for United States farm operations. It tracks farm income and expenses against an IRS Schedule F–aligned chart of accounts, runs payroll (including piece-rate labour), manages vendors for 1099-NEC reporting, and produces reports including a print-ready Schedule F prep report. Payroll, vendors and the Schedule F report are Pro features (see §2).

Pro dashboard — Chart.js donut for YTD expense breakdown, monthly income vs expense line, budget vs actual bars, and payroll widget.

FarmBooks ships as two coordinated plugins:

- **BlueFairy FarmBooks** (the free plugin, `bluefairy-farmbooks`) — the chart of accounts and categories (add, edit and delete your own), the transaction ledger, the YTD dashboard with Quick Add, the YTD Summary / Income List / Expense List reports, and Settings.
- **BlueFairy FarmBooks Pro** (`bluefairy-farmbooks-pro`) — paid add-on that layers vendors, employees, payroll, budgets, Schedule F Prep, Cash Flow, Profit & Loss, Budget vs Actual, Payroll Summary, WooCommerce sync, receipt attachments, sodium-

encrypted SSN/EIN storage, plugin-scoped 2FA, and plugin updates through your licence key. Pro needs the free plugin installed and active.

2. Free vs Pro at a Glance

Feature	FarmBooks (free)	Pro
Chart of accounts (Schedule F–aligned)	✓ add, edit, delete (seeded defaults: edit only)	✓ (provided by the free plugin)
Income & expense transactions	✓	✓ + vendor, account code, tax-deductible flag, receipt attachment
Categories	✓ add, edit, delete (seeded defaults: edit only)	✓ (provided by the free plugin)
Dashboard	✓ YTD Income / YTD Expenses / Net, 10 most recent transactions, Quick Add	✓ + expense donut, monthly income vs expense line, budget bars, payroll widget
Reports	YTD Summary, Income List, Expense List	+ Profit & Loss, Cash Flow, Schedule F Prep, Budget vs Actual, Payroll Summary
Vendors + 1099-NEC CSV export	—	✓
Employees + payroll wizard + W-2 CSV	—	✓
Budgets grid + auto-save	—	✓
WooCommerce order sync	—	✓
SSN / EIN sodium encryption	—	✓
Plugin-scoped two-factor auth	—	✓
Plugin updates through a licence key	—	✓

3. Requirements

Requirement	Minimum
WordPress	6.4 for FarmBooks (free); 6.5 for FarmBooks Pro
PHP	8.1 (the sodium extension is needed for Pro's SSN/EIN encryption and two-factor)
Free plugin (Pro dependency)	BlueFairy FarmBooks (`bluefairy-farmbooks`) 1.0.1 or later, installed and active
WooCommerce (optional)	Only for order sync; Pro loads its WooCommerce module only when WooCommerce is active
Action Scheduler (optional)	Comes with WooCommerce; when present, the historical order import runs in the background through it

4. Installation

Automatic (WordPress Admin)

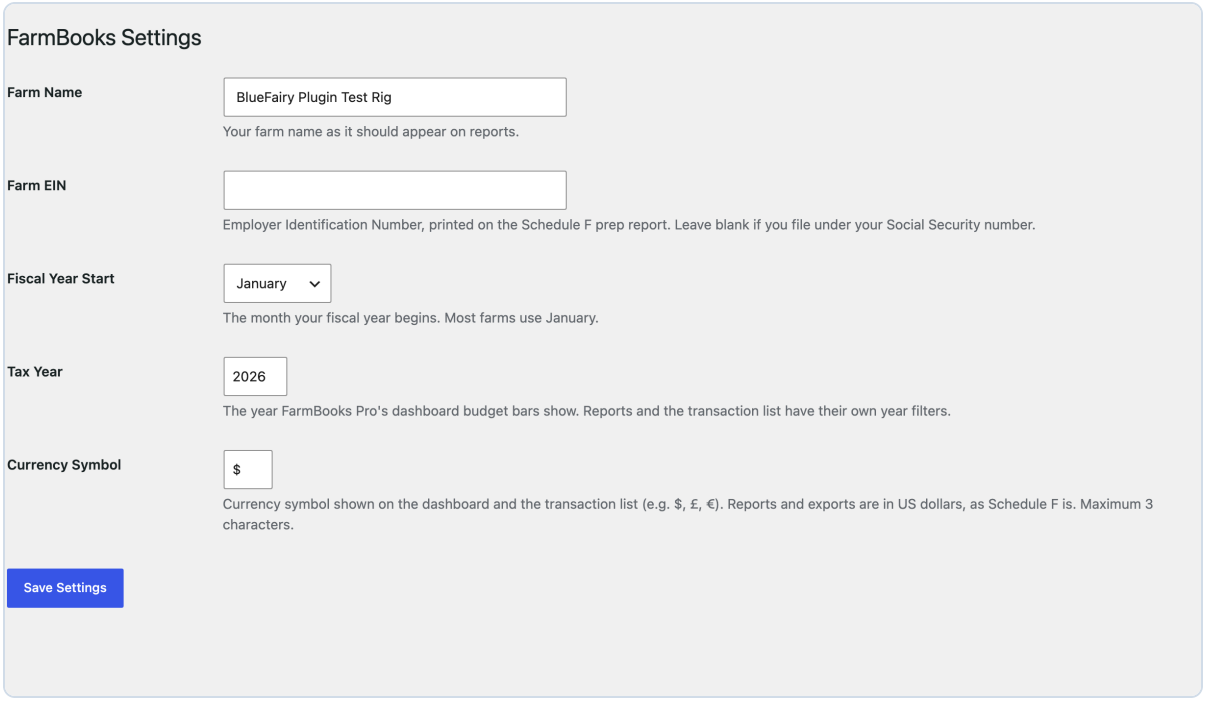

1. Install and activate the free **BlueFairy FarmBooks** plugin (`bluefairy-farmbooks`) first. Pro declares it as a required plugin, so WordPress will not activate Pro without it.
2. In your admin, go to **Plugins** → **Add New Plugin** → **Upload Plugin**.
3. Choose `bluefairy-farmbooks-pro.zip` and click **Install Now**.
4. Click **Activate Plugin**.
5. Enter your licence key under **FarmBooks** → **Licence** and press **Activate** (see §16). That is what brings updates.

Manual (ZIP Upload / FTP)

1. Unzip `bluefairy-farmbooks-pro.zip` locally.
2. Upload the `bluefairy-farmbooks-pro/` folder to `wp-content/plugins/` via FTP, SFTP, or your host's file manager.
3. In **Plugins**, click **Activate** (the free plugin must already be active).

Post-Activation Setup

1. **Set the encryption key** — before saving any SSN or EIN, or setting up two-factor, add `BFFBP_ENCRYPTION_KEY` to your `wp-config.php`. FarmBooks → Encryption generates the line for you (see §14).
2. **Configure the farm** — FarmBooks → Settings: farm name, farm EIN, fiscal year start, tax year, currency symbol.
3. **Review the default chart of accounts** — FarmBooks → Accounts. Add accounts, or edit the defaults, to match your operation.
4. **Review categories** — FarmBooks → Categories. Link each category to an account: the account's Schedule F line decides where that category's transactions land on the Schedule F Prep report.
5. **Add vendors and employees** as needed (§7, §8).

Settings page — farm name, EIN, fiscal year start, currency, tax year.

5. Chart of Accounts & Categories

Path: FarmBooks → Accounts / Categories.

FarmBooks seeds a Schedule F–aligned chart of 33 accounts on activation: 8 income accounts for the Part I lines and 25 expense accounts for lines 10–32. Each account has a type (Income, Expense, Asset, Liability or Equity) and a Schedule F Line, which drives the Schedule F Prep report in Pro. Use **Add Account** and the **Edit** / **Delete** row actions to manage them.

Categories are the day-to-day tags you put on transactions (e.g. "Seeds & Fertilizer" or "Crop Sales"). Ten are seeded, each linked to a default account. Add new categories with **Add Category** as your operation grows and link each to an account: its Schedule F line comes from that account.

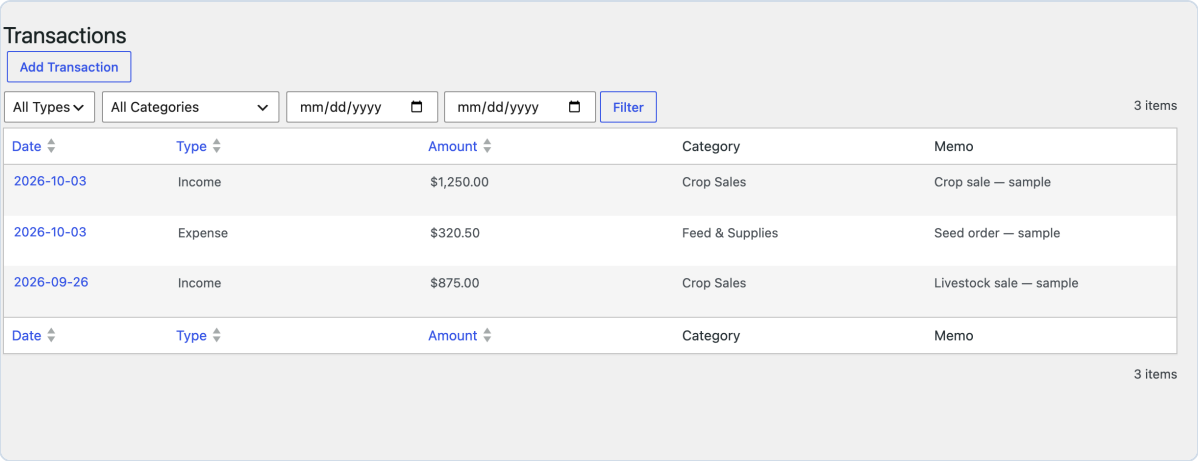

> **Tip.** The seeded accounts and categories can be edited but not deleted. An account or category that is still in use (by a transaction, by a category for an account, or with Pro by a budget or the WooCommerce category mapping) cannot be deleted either.

6. Transactions

Path: FarmBooks → Transactions.

Every farm income and expense event is a *transaction*: type (income / expense), date, amount, category, memo, and — with Pro — vendor, account code override, tax-deductible flag, and an optional receipt attachment (PDF / JPEG / PNG / GIF). Transactions can also be added from the Dashboard's **Quick Add** form.

Receipts are stored in `wp-content/uploads/farmbooks/receipts/YYYY/MM/` under a random file name. FarmBooks writes deny rules (`.htaccess` and `web.config`) into those folders so Apache and IIS refuse direct requests for them; Nginx ignores those files, so there the random name is the protection. A transaction's edit screen names its current attachment, which opens through a link that checks you are an administrator (so it opens on every web server), and has a **Remove** box.

Transaction list — filter by type, date, or category. Click Edit to attach a receipt or flag as tax deductible.

Field	Notes
Type	Income or expense — determines which side of Schedule F the transaction lands on
Date	Required. Reports select transactions by calendar year; the Dashboard's YTD figures count from your fiscal year start
Amount	Required and always positive; income or expense comes from the type
Category	Optional, but a transaction with no category (and, in Pro, no account code) has no Schedule F line and is listed as not included on the Schedule F Prep report
Memo	Free text
Vendor (Pro)	Optional; the 1099-NEC export totals a flagged vendor's expense transactions
Account code (Pro)	Overrides the category's account for this one transaction
Tax deductible (Pro)	"Mark as tax deductible", ticked by default (and for rows added by Quick Add or WooCommerce sync). Untick it for an expense that is not deductible: Schedule F Prep and Profit & Loss then leave it out and say so in a warning above the report
Receipt (Pro)	File upload (PDF, JPEG, PNG, GIF); the file is stored as described above

7. Vendors & 1099-NEC

Path: FarmBooks → Vendors.

Vendors are anyone you pay who might need a 1099-NEC at year end (custom-hire operators, mechanics, seasonal contractors, feed suppliers, etc.). A vendor record holds name, contact name, address, phone, email, EIN and notes. Tick **Flag this vendor for 1099-NEC reporting** on each vendor you may need to send a 1099-NEC.

At tax time, pick the tax year under **1099-NEC Export** on the Vendors page and click **Export 1099-NEC CSV**. The CSV lists every flagged vendor whose expense transactions in that calendar year reach that year's reporting threshold — **$600** through 2025, **$2,000** for payments made from 2026 (indexed for inflation from 2027) — with name, EIN, address, the Box 1 nonemployee compensation total and the tax year, for preparing the forms with your 1099 filing service or accountant. Confirm the threshold for your year with your tax preparer.

> **EIN encryption.** Vendor EINs are stored encrypted (XSalsa20-Poly1305 via libsodium) with your encryption key (§14). Until a key is defined, the EIN field is disabled with an "Encryption not configured" placeholder — no plaintext EINs are ever written to the database. Before entering EINs, confirm FarmBooks → Encryption shows **Encryption Active**.

8. Employees & SSN Encryption

Path: FarmBooks → Payroll → **Add Employee** (or **Edit** on an employee in the list).

An employee record holds first / last name, SSN, address, filing status (single / married / head of household), which W-4 is on file (2020 or later, or 2019 or earlier), federal allowances (2019-or-earlier W-4 only), W-4 Step 2 multiple jobs, Step 3 dependent credits, Step 4(a) other income, Step 4(b) deductions, additional federal withholding (Step 4(c)), withholding state, state withholding allowances, additional state allowances, state dependents (Kansas), additional state withholding, pay type (hourly / salary (annual) / piece rate), pay rate, piece-rate unit (free text, e.g. bin, head, acre), pay frequency (weekly / bi-weekly / semi-monthly / monthly), hire date, termination date, and an active status. Employees are deactivated or reactivated from the list rather than deleted.

SSN is stored encrypted the same way as vendor EINs. The SSN input on the employee form only appears when an encryption key is defined; otherwise the field shows the "Encryption not configured" guard.

> **An SSN that cannot be stored is reported, not dropped.** If an SSN is entered but cannot be encrypted (for example, the key does not decode to 32 bytes), the rest of the employee record still saves and the Payroll screen says in red that the Social Security number was NOT stored. Fix the key, then re-enter the number. A vendor EIN is handled the same way on the Vendors screen.

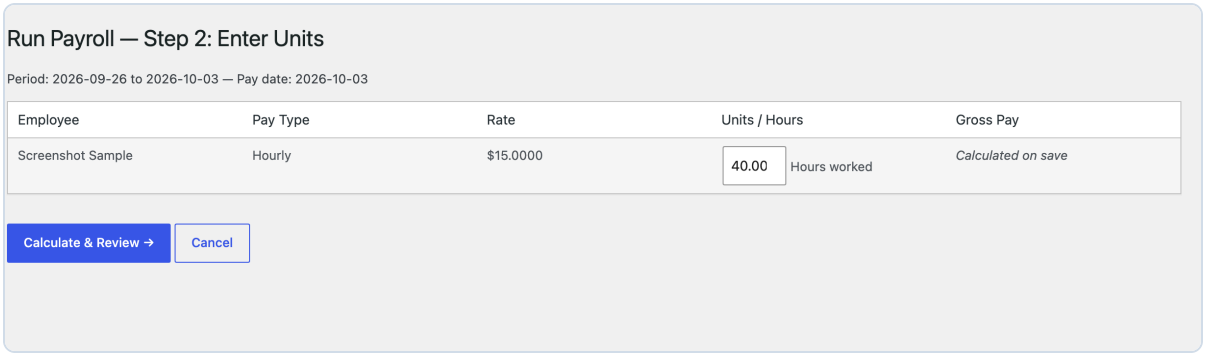

9. Payroll Wizard

Path: FarmBooks → Payroll → **Run Payroll**.

The payroll wizard is a three-step flow that turns a pay period, a list of employees and the hours or units each worked into a payroll run with federal income tax, state income tax, Social Security and Medicare withholdings, calculated from the federal tables for the pay date’s year.

1. **Step 1 — Select Period & Employees.** Pick period start, period end, and pay date. Tick the active employees to include (or Select All). Optional notes. Click **Next: Enter Units**.

2. **Step 2 — Enter Units.** Enter hours worked (hourly), units (piece rate), or leave periods at 1 (salary) for each employee, then click **Calculate & Review**. Pay and withholdings are calculated when you do.
3. **Step 3 — Review & Confirm.** Review each employee's gross, federal tax, state tax, Social Security, Medicare and net pay, and the run totals. A warning appears if an employee could not be written to the run or came out with negative net pay. **Confirm & Mark Paid** marks the run paid; **Back: Edit Units** returns to step 2. Until it is confirmed the run is a draft, which you can **Continue** or **Delete Draft** from the Payroll Runs list.

Payroll wizard step 2 — enter hours or units for each employee; pay and withholdings are calculated when you click Calculate & Review.

Once a run is paid, each employee's line has a **View / Print** link that opens their pay stub as an HTML page in your browser; print it, or save it as PDF, from the browser. At year end, **Export W-2 CSV** under W-2 Data Export on the Payroll page gives, for the tax year you pick, each employee's W-2 boxes 1–6 and 15–17, totalled from paid runs whose pay date falls in that year.

Supported tax tables

Federal tables are maintained per tax year, with **2025 and 2026** both shipping, and payroll is refused outright for a year no tables exist for rather than calculated on the wrong year. State tables cover **California, Texas, Iowa, Illinois, Minnesota, Nebraska, and Kansas**, each built from that state's own published formula. Enter each employee's state withholding certificate on their record (State Withholding Allowances, Additional State Allowances, and State Dependents for Kansas). These default to zero, which is what the states assume when no certificate has been filed; leaving them at zero for an employee who filed one withholds more than it should. For an employee in any other state, the employee screen says there are no built-in tables for that state: enter the per-period amount in **Additional State Withholding** and it is applied on every run.

FarmBooks shows a warning on its screens when the current year's federal tables have not been verified against the IRS publication, or when a state table is from an earlier year.

10. Budgets Grid

Path: FarmBooks → Budgets.

An inline-editable category × month grid. Each cell saves automatically when you leave it. The Annual column updates live as you type. Use the **Tax Year** selector at the top to switch between planning years.

The **Budget vs Actual** report and the dashboard's budget bars (for the Tax Year set in FarmBooks → Settings) read from this grid, so keeping it current gives you a running variance view all year.

11. Reports (Free & Pro)

Path: FarmBooks → Reports.

Reports render in tabs, with a Year selector (the current year and the five before it). The free plugin provides three tabs; Pro adds five more.

Tab	Plugin	What it shows
YTD Summary	Free	Total income, total expenses and net income / (loss) for the selected calendar year
Income List	Free	Income transactions in a date range (default: the selected year), optionally for one category, with a total
Expense List	Free	Expense transactions in a date range (default: the selected year), optionally for one category, with a total
Profit & Loss	Pro	Income and expenses by account with Schedule F line, the selected year against the prior year, and net profit / (loss)
Cash Flow	Pro	Operating activities only: farm income, farm expenses and net operating cash flow, by category and month
Schedule F Prep	Pro	Part I income and Part II expense totals by Schedule F line, laid out like Form 1040 Schedule F
Budget vs Actual	Pro	Each budgeted category month by month, budgeted against actual, with annual budgeted, actual and variance
Payroll Summary	Pro	Each paid payroll run in the year (pay date, period, employees, gross, federal tax, state tax, SS, Medicare, net) with annual totals

Every Pro report has an **Export CSV** button (Budget vs Actual once a budget exists for the year). Any report can be printed, or saved as PDF, from the browser.

Schedule F Prep Report

For informational use only — consult your tax preparer before filing.

Farm Name: BlueFairy Plugin Test Rig **EIN:** — **Tax Year:** 2026

Part I — Farm Income (Cash Method)

Line	Description	Amount
1	Sales of livestock and other items bought for resale	—
2	Sales of livestock, produce, grains, and other products you raised	$2,125.00
3a	Cooperative distributions received	—
4a	Agricultural program payments	—
5a	CCC loans reported under election	—
6a	Crop insurance proceeds and disaster payments	—
7	Custom hire (machine work) income	—
8	Other income, including fuel tax credits or refunds	—
9	**Gross income (add lines 1 through 8)**	**$2,125.00**

Part II — Farm Expenses

Line	Description	Amount
10	Car and truck expenses	—
11	Chemicals	—
12	Conservation expenses	—
13	Custom hire (machine work)	—
14	Depreciation and section 179 expense	—
15	Employee benefit programs	—
16	Feed	$320.50
17	Fertilizers and lime	—
18	Freight and trucking	—
19	Gasoline, fuel, and oil	—
20	Insurance (other than health)	—
21a	Interest — mortgage (paid to banks etc.)	—
21b	Interest — other	—
22	Labor hired (less employment credits)	—
23	Pension and profit-sharing plans	—
24a	Rent or lease — vehicles, machinery, equipment	—
24b	Rent or lease — other (land, animals)	—
25	Repairs and maintenance	—
26	Seeds and plants purchased	—
27	Storage and warehousing	—
28	Supplies purchased	—
29	Taxes	—
30	Utilities	—
31	Veterinary, breeding, and medicine	—
32	Other expenses	—
33	**Total Expenses (add lines 10–32)**	**$320.50**

Net Profit / (Loss) — Line 34 **$1,804.50**

Schedule F Prep — Part I (Farm Income) and Part II (Farm Expenses) line-by-line, in IRS Form 1040 Schedule F layout.

The Schedule F Prep report shows your farm name, farm EIN and the tax year, then the total for each Part I income line (1–8; custom hire income is line 7 and other income line 8, as on the 2025 form) and Part II expense line (10–32) for the selected calendar year, gross income (line 9), total expenses and net profit or loss, for you or your accountant to work from. A yellow "For informational use only — consult your tax preparer before filing." banner appears at the top of the report.

Transactions that cannot be placed on a line are not counted, and a warning above the report gives their number and total: those with no account (through their category or their own account code), an account with no Schedule F line, an account of the opposite type (an expense coded to an income account, or the reverse), or an expense marked not tax deductible.

12. WooCommerce Integration

Path: FarmBooks → WooCommerce (visible only when WooCommerce is active).

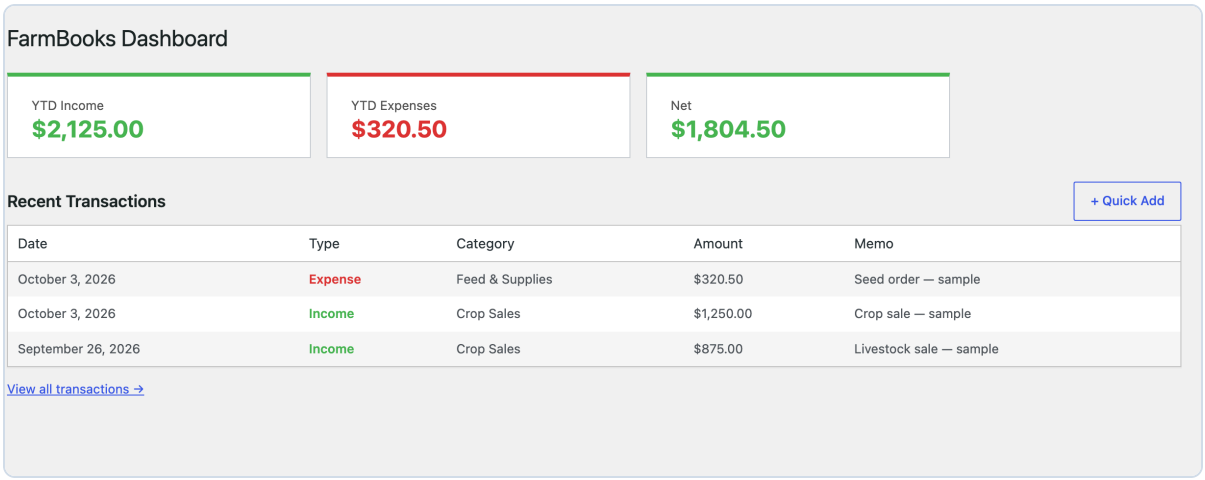

With **Enable Sync** ticked, every WooCommerce order that reaches `completed` status creates a matching FarmBooks income transaction for the order total, dated the day the order was completed, with the memo “WooCommerce Order #…”. The category comes from the order’s product categories through the **Product Category Mapping** table on this page, or falls back to the **Default Income Category** you pick. An order with no mapped category and no default set, or with a total of zero, is not recorded.

- **Duplicate guard.** A UNIQUE index on `wc_order_id` ensures a WooCommerce order can only appear once in FarmBooks.
- **Historical import. Start Historical Import** imports every previously completed order in batches of 50, in the background through Action Scheduler when it is available, otherwise from the browser while the page stays open. Orders already imported are skipped. Enable sync and save first.

13. Dashboard

Path: FarmBooks → Dashboard.

The free plugin shows three tiles — YTD Income, YTD Expenses and Net, counted from the start of your fiscal year (Settings → Fiscal Year Start) — then the ten most recent transactions and a **+ Quick Add** form for entering a transaction without leaving the page.

Free dashboard — YTD tiles, recent transactions and Quick Add.

Pro adds four more widgets, drawn with Chart.js (shipped inside the plugin) after the page loads:

- **Expense Breakdown (YTD)** — donut chart of the top 5 expense categories since the start of the fiscal year
- **Income vs. Expenses (Monthly)** — line chart for the current calendar year, one line each for income and expenses
- **Budget vs. Actual** — a bar per budgeted category showing the share of its budget spent, for the Tax Year set in Settings
- **Payroll** — the last paid run: pay date, period and total gross

14. Encryption Setup

Path: FarmBooks → Encryption.

SSN and EIN storage, and two-factor enrolment, need an encryption key defined in `wp-config.php` as the `BFFBP_ENCRYPTION_KEY` constant. The key is 32 random bytes, base64-encoded. The page checks that the PHP sodium extension is available, generates a fresh key for you, and shows the exact line to paste immediately before the line that reads *That's all, stop editing!*. Reload the page afterwards: its status table should read **Encryption Active**.

```
define( 'BFFBP_ENCRYPTION_KEY', 'base64-encoded-32-byte-key-goes-here' );
```

Sites set up before this name existed may use `BFFB_ENCRYPTION_KEY`; it is still honoured. If both are defined, `BFFBP_ENCRYPTION_KEY` wins. Without a key, the SSN and EIN fields are

disabled and an admin notice links to this page; a key that does not decode to 32 bytes is reported on this page as invalid.

> **Back up your key.** If the key is lost or changed, every SSN and EIN encrypted with it can no longer be decrypted. There is no built-in key rotation: changing the key means re-entering every SSN and EIN, and setting up two-factor again. Store the key in a password manager alongside your `wp-config.php` backup.

15. Two-Factor Authentication

Path: FarmBooks → 2FA Security.

Plugin-scoped TOTP two-factor authentication for the FarmBooks screens (including the edit screens reached by link, such as Edit Employee) and Pro's own form and AJAX actions. It works with standard authenticator apps (Google Authenticator, Aegis, Authy, or any TOTP-compatible app). The encryption key (§14) must be set first: your authenticator secret is stored encrypted with it.

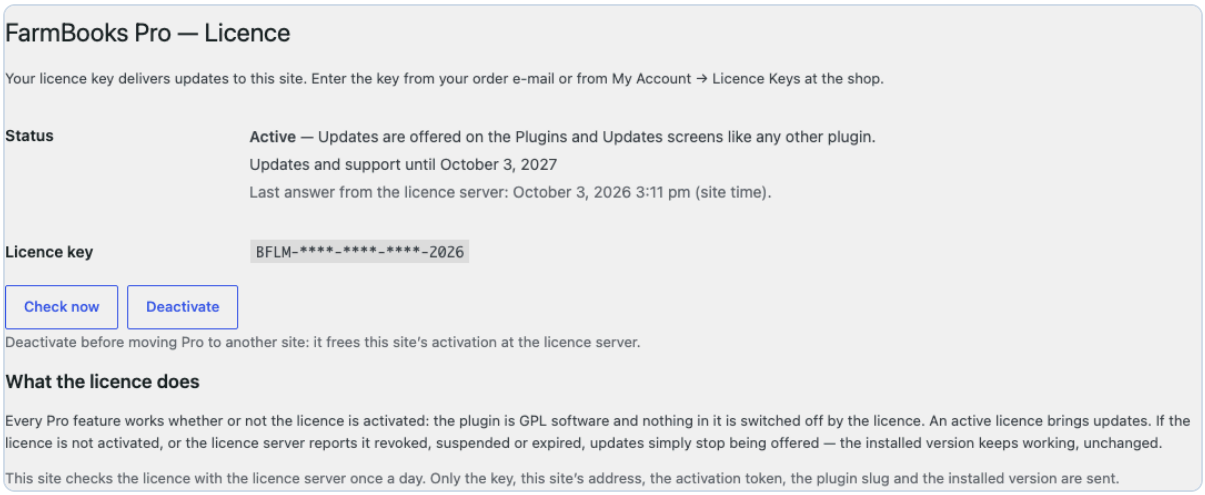

1. Open **2FA Security**. Scan the QR code (or copy the setup key) into your authenticator app.
2. Enter the 6-digit code from the app and click **Enable Two-Factor Authentication**. Eight one-time backup codes appear once — store them somewhere safe. You are verified for the current session straight away.
3. From then on, opening a FarmBooks screen asks for a code once per session window (default 8 hours, settable from 1 to 72), and again after you log out and back in.

- **Each code works once.** A code that has just been used, including the one you enrolled with, is refused until your app shows the next one (codes change every 30 seconds).
- **Other ways in.** The verification screen also takes a backup code (each works once). Users without an authenticator are e-mailed a 6-digit code that expires in 15 minutes.
- **Lockout.** After five wrong codes in a row, wait 30 seconds before trying again.
- **Your account. Regenerate Backup Codes**, **Remove 2FA**, and **Make Optional** / **Require on My Account** are on the same page.
- **Site settings. Require 2FA for all administrators** challenges every user with Manage Options access, and **Session duration (hours)** sets the window. The **Enrolled users** list lets an administrator remove another user's enrolment so they can set up a new device.

16. Licence Management

Path: FarmBooks → Licence.

Your licence key delivers updates. Enter the key from your order e-mail (also under **My Account → Licence Keys** at the shop) and press **Activate**; new versions then arrive on the **Plugins** and **Updates** screens like any other plugin update, with *View details* from the shop.

FarmBooks → Licence: an active licence, its updates term and the key, masked to its last group.

- **Status** — Active, Invalid (the shop's reason is shown; a refused key is not stored), Not active (revoked, suspended or expired at the shop, or the shop no longer recognises this site's activation), or Not activated (no key entered). A second line shows how long updates run: *Updates and support until* a date, *Lifetime updates*, or *Updates ended on …* with a **Renew** link to the shop.
- **Check now** asks the shop again; the site also checks once a day.
- **Deactivate** frees this site's activation at the shop and forgets the key. One key activates one site: deactivate before moving Pro to another site (staging to production, for example).

The licence decides updates and nothing else. Every Pro feature works whether or not the licence is activated: FarmBooks Pro is GPL software and nothing in it is switched off by the licence. When the updates term ends, releases made during it are still offered; anything released after it shows as available with a renewal.

The screen is for users who can both manage options and update plugins (on multisite: a super admin, on the main site). Only the key, this site's address, the activation token, the plugin slug and the installed version are ever sent to the shop — nothing about your books, employees or vendors.

17. WP-CLI Reference

Neither FarmBooks plugin adds WP-CLI commands of its own. These standard WP-CLI commands are useful with it.

```
# List the FarmBooks tables (free and Pro)
wp db query "SHOW TABLES LIKE '%bffb%'"

# Schema versions: free plugin, then Pro
wp option get bffb_db_version
wp option get bffbp_db_version

# Check the licence with the shop now / forget the cached update answer
wp cron event run bffbp_licence_check
wp transient delete bffbp_licence_update --network

# Show the active FarmBooks plugins
wp plugin list --status=active | grep farmbooks

# Reactivate Pro (re-runs its schema installer)
wp plugin deactivate bluefairy-farmbooks-pro && wp plugin activate bluefai
ry-farmbooks-pro

# Show a payroll run (replace 42 with the run's ID)
wp db query "SELECT * FROM $(wp db prefix)bffb_payroll_runs WHERE id = 42"
```

18. Uninstalling

Deactivating either plugin keeps all data. Deleting a plugin from **Plugins → Installed Plugins** also keeps your farm data by default, so you can safely upgrade, downgrade, or migrate. Each plugin has its own opt-in constant for a full wipe, added to `wp-config.php` *before* clicking Delete; one does not trigger the other.

```
define( 'BFFBP_REMOVE_DATA', true );  // FarmBooks Pro
define( 'BFFB_REMOVE_DATA', true );   // FarmBooks (free)
```

- **FarmBooks Pro** always removes its licence (key, activation token, cached update answer and the daily licence check) when deleted, without contacting the shop: use **Deactivate** on FarmBooks → Licence first to free this site's activation. With `BFFBP_REMOVE_DATA` set it also deletes the receipt files under `wp-content/uploads/farmbooks/`, drops the vendor, employee, payroll, budget and attachment tables, removes Pro's columns and indexes from `bffb_transactions`, deletes every `bffbp_` option and transient, and clears the two-factor user meta for all users.
- **FarmBooks (free)** with `BFFB_REMOVE_DATA` set drops its transactions, categories, accounts and settings tables and deletes its `bffb_` options. Pro's own tables, options and receipt files are untouched.

On multisite, both clean every site in the network.

19. Troubleshooting

Symptom	Cause / Fix
"Encryption not configured" on Vendor / Employee edit	Add `BFFBP_ENCRYPTION_KEY` to wp-config.php (§14). Reload the page.
"BlueFairy FarmBooks Pro requires BlueFairy FarmBooks 1.0.1 or later. Please install and activate BlueFairy FarmBooks."	The free plugin is missing or inactive. Install and activate `bluefairy-farmbooks`; Pro's features return as soon as it is active.
"BlueFairy FarmBooks Pro requires BlueFairy FarmBooks 1.0.1 or later. Please update the free BlueFairy FarmBooks plugin."	The free plugin is older than 1.0.1. Update it.
WordPress will not activate Pro	Pro declares the free plugin as required. Install and activate `bluefairy-farmbooks` first.
Need a PDF of a pay stub or report	Pay stubs and reports are HTML pages. Open the pay stub with **View / Print** (or the report), then print it or save it as PDF from the browser. Pro reports also export as CSV.
Dashboard charts blank	Confirm JavaScript is enabled and check the browser console for errors. Try flushing your caching plugin.
Payroll run stuck in `draft`	Click **Continue** on the run in the Payroll Runs list, then **Confirm & Mark Paid** at step 3. Only paid runs count in the Payroll Summary report, the W-2 export and the dashboard payroll widget.
Expenses missing from Schedule F Prep or Profit & Loss	Read the warning above the report. Give each transaction a category whose account has a Schedule F line, or set its Account Code, and leave **Mark as tax deductible** ticked on deductible expenses.
WooCommerce menu item missing	FarmBooks → WooCommerce only appears when WooCommerce is active. Activate WooCommerce, then reload.
2FA locked out	Use one of your eight backup codes. Otherwise another administrator can click **Remove enrolment** for you under

Symptom	Cause / Fix
	FarmBooks → 2FA Security. If you are the only administrator, run `wp user meta delete <user> bffbp_2fa_secret_ct`: FarmBooks then e-mails you a code at the verification screen, and you can set up a new device.
"Invalid code — please try again." for a code you just used	Each authenticator code works once. Wait for your app to show the next code.

20. Support

Blue Fairy Development provides support to licensed FarmBooks Pro customers via the support portal or email at support@bluefairydevelopment.com.

Bug reports are especially welcome — please include your WordPress version, PHP version, the version of each FarmBooks plugin (for example FarmBooks 1.0.2 and FarmBooks Pro 1.2.0), the exact page URL, and any error message text.

21. Upgrade to FarmBooks Pro

The free plugin keeps your books. **Pro runs your farm.** If you pay anyone — even one seasonal hand — or you file a Schedule F, the difference below is the difference between a ledger and an accounting system.

FEATURE	PRO	FREE
Income and expense ledger	✓	✓
Farm chart of accounts, mapped to Schedule F lines	✓	✓
YTD Summary, Income and Expense lists	✓	✓
Multisite aware	✓	✓
Profit & Loss, Cash Flow and Schedule F reports	✓	—
Farm payroll — hourly, salary and piece-rate	✓	—
Federal withholding tables (IRS Pub 15-T), 2025 and 2026	✓	—
State withholding for CA, IA, IL, KS, MN, NE and TX	✓	—
W-2 and pay stub output	✓	—
Vendors and 1099-NEC	✓	—
Budgets and Budget vs Actual	✓	—
Receipt attachments	✓	—
WooCommerce sales sync	✓	—

Without Pro you are doing payroll by hand: working out federal and state withholding yourself, typing W-2s, and rebuilding a Schedule F every spring from a spreadsheet. Pro does all three from the transactions you are already entering, and warns you on screen when the current year's federal tables have not been verified against the IRS publication.

> **Get FarmBooks Pro — $129/yr →**
> One licence, unlimited transactions and employees, every report.
